Probability and statistics giving you sleepless nights? Having trouble calculating or interpreting the p value, or not sure how or when to use the Bayes Rule, or the difference between the t-test, paired t-test and the single factor ANOVA? What is the Mean Squared Error? Standard Error? Residual? Covariance?

Big words that are easily explained. Once you learn the concepts you will never have to guess which test or formula to use, and you will be able to confidently construct a confidence interval.

Let me help you learn statistics and show you it does not require any special talent. References provided on.
