Hi,

I do not own a pickup, and I just need the cheapest and quickest way to accomplish a small task. I have a small warehouse with a garage bay door just wide enough for a mid-size car. The warehouse is on a slab, and the drop from the slab level to the ground is too steep for my very low car.

This could be done with bricks, concrete blocks, stones and a shovel. I honestly don't know the cheapest way to accomplish this. Hell, a few bags of cement might be best. I do not own the warehouse, but the landlord is cool with any quality improvement I wish to make.

The finished product just needs to look nice, and be set to last.

Please email me your phone number and your suggestion. If you live close by, you are welcome to come take a look. You may know where to get the right materials for cheap or already have them.

I am not interested in a trip to Lowes and their high prices. Used bricks/materials are fine...I just need the entrance slope angle reduced so my car can easily enter the warehouse.

Thank
