Prostaglandin Abortion
Four to six months of pregnancy

Prostaglandins are naturally produced chemical compounds which normally assist in the birthing process. The injection of concentrations of artificial prostaglandins prematurely into the amniotic sac induces violent labor and the birth of a child usually too young to survive. Often salt or another toxin is first injected to ensure that the baby will be delivered dead, since some babies have survived the trauma of a prostaglandin birth and been born alive. This method is used during the second.
