Kamagra 100 mg is a medication that is commonly used to treat erectile dysfunction (ED) in men. It belongs to a class of drugs known as phosphodiesterase type 5 inhibitors. The main way it works is by inhibiting the enzyme responsible for breaking down cGMP, a substance that plays a crucial role in achieving and maintaining an erection. By doing so, Kamagra 100 mg helps increase the levels of cGMP in the corpus cavernosum, which is a spongy tissue in the ****. When taken orally, Kamagra 100 mg relaxes the muscles in the blood vessels of the ****, allowing for improved blood flow and facilitating the ability to attain an erection. It also aids in maintaining the erection for an extended period of time by increasing blood circulation to the ****. The effects of Kamagra 100 mg usually last for about 4 to 6 hours.
