Flunitazene, also known by its street name Fluonitazene, is a synthetic compound belonging to the class of drugs known as benzodiazepine analogs. First synthesized in the 1970s, Flunitazene was developed for its anxiolytic and sedative properties. However, it has gained notoriety over the years for its potent effects and potential for misuse. Like many synthetic drugs, it can produce significant pharmacological effects, including sedation, muscle relaxation, and anxiolysis, making it a subject of interest in both medical and recreational contexts.
